Brief

Run your applications successfully in Internet Explorer 11

HP Configuration and Deployment:
Web Application Accelerator Service for Internet Explorer 11

Reduce disruption, complications, and risks associated with Internet Explorer 11 when you update to Windows 10.

Benefits you'll receive as part of this service include:

- Service planning
- Web application audit
- Web application testing for IE11 compatibility and Java version dependencies
- Web application remediation—design and testing
- Roll-out planning and execution

Ensure web application compatibility with IE11

You've heard about all of the great advantages of Windows 10, but might be concerned that a migration will cause major disruption and headaches for your business. It's true that certain changes will present a number of challenges for companies: both Windows® and web applications need to be validated to run in the new environment; the impact on security and system management strategies must be assessed; and implications on mobile devices should be considered.

That's why HP has developed the Web Application Accelerator Service for Internet Explorer 11. As part of this service, we'll collect information about the full list of web applications in use, determine if they will run successfully in IE11, and then cover the design and implementation of any remediation needed for applications that fail.

We'll also examine any dependencies that individual web apps may have with regard to specific versions of Java. The service will similarly design and implement any required remediation, so you no longer have to worry about managing particular Java versions for your applications.

Ensuring the best approach

In order to determine the correct approach to audit web applications and their owners, we'll hold planning sessions and provide complete discovery of your web app landscape.

Initial testing

We'll determine the web applications that run successfully in IE11 and identify those that don't, as well as test for Java version dependencies.

Choose to order the Web Application Accelerator Service for Internet Explorer 11 as either a product or a service contract.

Remediation when necessary

The service provides design and test remediation for the web applications that need it. This covers both IE11 compatibility and Java version support.

Easy execution

Finally, we'll design the roll-out plan and complete it in phases.

- **Reduce disruption** when moving to Windows 10 by eliminating the need to rewrite web applications.
- **Remove complications** associated with supporting multiple Java versions.
- **Mitigate risk** by addressing any IE11 compatibility issues beforehand.
