

Transform your large-format printing workflow—process by process

Save time and avoid manual errors with optional HP SmartStream software modules

More customers are discovering the value of HP SmartStream software—namely its speed and efficiency. But that's just the beginning. We're also exploring ways to automate manual tasks in order to boost your productivity even further and create new market opportunities. To begin, we're offering two optional HP SmartStream modules that radically simplify renaming and automate the quoting process.

Pixel Analysis Module

Provide accurate and timely quotes to customers before printing

Estimating job costs can be a frustrating process—especially if you've underbid the project. Now you can remove guesswork from the equation with the Pixel Analysis Module, which offers an accurate estimation of job and page prices.

This sophisticated tool examines the pixel coverage of jobs before printing—including mono and color coverage. **Eliminate charging mistakes and save valuable time.**

1

Perform the initial one-time pricing setup.

2

The module will automatically analyze “color” and “total” pixel coverage at the page level for each job and then send that information to you.

3

Save money. Obtain accurate job quotations at the push of a button.

Document Organizer Module

Reassemble and rename large file sets

The process of renaming files is excruciatingly time consuming, which is why some reprographic companies charge customers per page as compensation for these efforts. HP has discovered a way to automate this process for you with the Document Organizer Module. It will significantly reduce effort and turn compensation into revenue generation.

The Document Organizer Module allows you to **rename files, create different versions of files, and reorder pages—all while saving up to 70% of your time.**¹ Innovative **OCR technology** helps you automatically—and instantly—read text on an unlimited number of pages. You can then use this information to rename large file sets, including batches, with minimal effort and mistakes.

1

Typically you receive large sets of incorrectly named files (.pdf, .tiff, and HPGL2) that you must manually rename one by one.

2

Select the area on the page to scan using OCR technology. Confirm you want to scan the same area on every page.

3

The module automatically renames all pages in the grid and on your computer.
